CUM: Deep-Seated Mineralization Potential

JOHN HAYES, BMO Capital Markets (12/13/2010)

"The company released results from infill and exploration drilling at the Copper Mountain Project (CUM 75% interest) located in southern British Columbia. Results from 10 intercepts in 8 holes from infill drilling at the Oriole zone returned a weighted average grade of 0.53% copper over an average intercept of 22.7m. The company is considering early stage mining of the Oriole area, some of which is already in the current reserves. At the Rifle area located ~1 km. south of Oriole, three intercepts in two holes returned a weighted average grade of 0.34% copper over an average intercept of 19.3m. The results confirm the presence of mineralization in an area originally planned for waste storage. More exploration is planned. Assays from two deep holes beneath the Pit 3 area and a number of deep holes in the super-pit area are pending assays. BMO Research continues to expect there is good potential for deep-seated mineralization at the project."
